

Unlock **120%+ HCC Capture**

Close Coding Gaps | Capture Every Opportunity | Maximize RAF.

Incomplete risk adjustment coding continues to leave significant value on the table. Missed diagnoses, inconsistent documentation, and manual chart reviews lead to under-captured risk and lost revenue.

Persivia CareSpace® changes that.

Powered by Persivia's proprietary AI, CareSpace® automatically identifies hidden HCC opportunities across clinical and claims data, helping organizations uncover diagnoses that might otherwise go unnoticed.

The Persivia Advantage

Proprietary AI for Intelligent HCC Identification

Persivia's patented AI analyzes structured and unstructured clinical data to detect potential HCC opportunities that traditional workflows often miss.

Automated Opportunity Detection

AI continuously scans patient records to uncover coding opportunities such as:

- Dropped diagnoses from prior year claims
- Previously documented conditions in clinical records
- Inferred diagnoses from lab values and medications
- Conditions identified through natural language processing of clinical notes

Longitudinal Patient Intelligence

CareSpace® aggregates data from across EMRs, claims, labs, medications, and clinical notes to create a complete patient profile, enabling more accurate risk identification.

Built-in Coding Intelligence

Persivia applies advanced logic to eliminate duplicates and map ICD-10 codes to the correct HCC categories, ensuring accuracy and consistency.

Turn Data Into Risk Adjustment Intelligence

With Persivia, healthcare organizations move beyond manual chart reviews and reactive coding processes to proactive, automated risk capture.
